GradStudio — final project brief

CSC13008 · CQ2024/31 · HK1 2026–27

GradStudio is the final project for the whole class. Every team keeps its members and builds GradStudio in its own repository. PA#2 to PA#6 are checked against this brief.

The idea, the requirements and the screens below come from the PA#1 work of Nguyễn Nhật Vy, Trần Kim Yến and Nguyễn Thị Trúc Hằng, the winners of the Final project poll. They are the class's **product owners** (section 6), and each of them earns 0.5 bonus points on the final project.

Your own PA#1 proposal keeps its mark. Nobody redoes PA#1.

The authors' Vietnamese original and a clickable prototype are at https://github.com/NhatVy177/gradstudio. Where the two differ, this brief wins.

1. The problem

Many photo studios advertise on social networks, then advise customers and settle appointments over Facebook or Zalo. A new customer has to hunt through individual posts and struggles to see packages, sample photos and reviews in one place. Customers need to know the reference price, which appointment is really booked, and each time they must be at the studio, such as make-up and the shoot. Relying on old messages, they easily forget a time or miss a change.

For the studio manager, searching conversations and then comparing the calendars of photographers, make-up artists, rooms and costumes easily causes double bookings. Staff also find it hard to track the work assigned to them. After the shoot, the photos a customer chose and the links to the final files are scattered across messages.

GradStudio brings services, sample photos, reviews and advice together on one website, and ties every step to **one booking from start to finish**. Both sides settle a time in chat after the resources are checked. The customer reviews the appointment and pays a 30% deposit to confirm it, gets reminders by email and in their account, then chooses and receives photos in that same booking.

2. Users

User	What they want to do
Superadmin	Create and manage Admin accounts; set system-wide settings such as opening hours and when reminders go out.
Customer (Khách hàng)	See packages, sample photos and reviews to choose a service; ask, or send a booking request; agree a shoot time; pay a 30% deposit to book; get reminders by email and in their account; choose the photos to be edited; receive the files. For a class yearbook, one representative manages the booking.

User	What they want to do
Admin / studio manager	Turn a conversation into a booking; choose a time with no clash of staff or rooms; assign and track upcoming shoots; change or cancel appointments; track payment status.
Studio staff (Nhân viên)	Know when and where they must shoot, do make-up or edit photos; update their work; put preview photos on the booking; finish the photos the customer chose.

3. Main flow

The Superadmin creates Admin accounts and sets the system-wide settings before the studio starts. This role takes no part in handling individual bookings.

1. **Ask.** The customer views the portfolio, earlier customers' reviews, shoot types and packages. After signing in, they **chat with the studio or send a booking request** with the shoot type, preferred time, and extras such as make-up or costume rental.
2. **Check and agree.** The Admin receives the chat or request, and advises on packages and prices. The system checks each staff member's calendar and each resource for exactly the time needed. On a clash, it gives the reason and suggests another time. In chat, the Admin proposes a new time and the customer agrees or declines there. The booking form is ready but cannot create a booking until the customer has agreed. The Admin then creates a booking linked to the conversation, with status **Chờ cọc 30%**.
3. **Deposit.** In **Lịch chụp của tôi** the customer reviews the package, the agreed times, the price (1.800.000đ in the example) and the 30% deposit (540.000đ), then pays through an online gateway. They do not confirm the time a second time. **Only when the deposit succeeds and the system re-checks the resources** does the booking move from **Chờ cọc** to **Đã đặt lịch**, which holds the slot, assigns staff and sets the preparation milestones. Until then, it does not hold the slot. Booked customers get a reminder by email and in their account 24 hours before the earliest milestone.
4. **Shoot.** Staff prepare, run the shoot and update its status, then put low-resolution previews in the booking's gallery. The customer signs in and chooses the number of photos to edit that the package allows.
5. **Finish.** After the shoot, and after choosing photos, the customer pays the remaining 70% online (1.260.000đ in the example). Staff edit the chosen photos and update progress. When payment and photos are complete, the Admin adds the file link and the customer presses **Nhận ảnh**. The shoot becomes **Hoàn thành**. On a cancellation or a change, the Admin re-checks the resources at the new time and updates the related work.

The example used on all three screens

Linh wants a graduation shoot with make-up on Saturday 24/10/2026 at 09:00. The make-up artist Mai is busy 08:00–12:00, so the studio proposes **make-up 13:00–14:00 with Mai, shoot 14:00–16:00 with Tuấn in Phòng B**. Linh agrees in chat. Admin Thảo creates booking **GS-1024**, package **Gói Tốt nghiệp Premium** (2 hours, 30 edited photos), shoot type **Tốt nghiệp cá nhân**, price **1.800.000đ**, deposit **540.000đ**, remaining **1.260.000đ**.

4. Scope

This is the starting scope. The product owners may narrow or clarify it (section 6).

Building

1. One studio with a catalogue of packages, extras, sample photos, customer reviews, and sample data for staff, rooms and costumes.
2. Customer, Staff, Admin and Superadmin accounts. The Superadmin creates and manages Admin accounts and the system-wide settings.
3. Advice by chat, or a request sent by the customer. The Admin checks for clashes by person and resource, suggests other times, creates a booking after the customer agrees, assigns staff, and changes or cancels appointments.
4. Customers see their agreed appointment and its status (waiting for deposit, booked). Staff see their assigned work. Reminders by email and in the customer's account.
5. An online payment gateway for the 30% deposit before the slot is held, and the remaining 70% after the shoot. Customers see, and Admins track, each booking's payment status.
6. A preview gallery per booking, where customers choose the photos to edit. Staff update progress and deliver final photos by link.

Not building

1. A marketplace comparing or booking several independent studios.
2. Crawling prices, reviews or availability from outside sources.
3. Automatic sync of Zalo or Facebook messages into GradStudio chat; SMS reminders.
4. A separate iOS or Android app. Customers and staff use the website on their phones.
5. Managing several branches or studios with separate staff, stock and revenue.
6. Automatic AI photo editing, or face recognition to sort photos.

5. Screens

These three screens show the features PA#2 needs. They are a starting point, not a picture to copy: your team chooses the screens, the layout, the content, the colours and the file names (`index.html` is the first page), and you may build them as static pages or with React. What counts is that your pages deliver these features and that none of the problems below appears in them.

Problems your pages must not have

The rubric calls this the *Fix these* list. Where an item names a screen or a sample value, it describes the authors' screens. Your own pages and content only have to avoid the same problem.

- **Photos of real people.** The hero, the service cards and the avatars show identifiable people, and the authors' own source list says the rights of the people pictured have not been checked. Use illustrations or initials, or licensed images whose source you name in `PROTOTYPE.md`.

- **Demo controls are not part of the product.** Remove *Màn 1 / Màn 2 / Màn 3*, *Đặt lại demo*, *Mô phỏng phản hồi của Linh* and *Mô phỏng thanh toán*. Moving along the flow uses real links, with labels a user would understand. The flow changes role twice and PA#2 has no sign-in, so say who continues, for example *Studio staff: open this conversation*.
- **Actions with no next page.** *Thanh toán cọc 30%*, sending a message and similar actions have no page to open in PA#2. Show them as disabled buttons with a short visible note. They do not count as things that lead nowhere; a link to `#` does.
- **One state per page is enough, and each page must show it when opened directly.** Screen 1 shows Linh's question in the chat. Screen 2 shows the moment after Linh agrees: 14:00 chosen, the conversation *Đã chốt lịch*, *Tạo booking* enabled, and a note that 09:00 clashed because Mai is busy 08:00–12:00. Screen 3 shows GS-1024 waiting for the deposit.
- **The form on Screen 2 is cut off.** The chat and the form share a column with its own scrollbar, so one view cannot show both. The chat and the whole *Booking mới* form must be readable by scrolling the page, at every width.
- **The resource calendar on Screen 2 cuts off its labels.** "Linh · yê…" and "Tốt nghiệ…" cannot be read. Every booking must be readable at every width, and a clash must not be shown by colour or hatching alone.
- **The chat box on Screen 1 floats over the page.** It covers the content behind it. At 360 px it must not hide anything.
- **Screen 1 promises too early.** Its process section says the studio *giữ lịch* at the *Chốt lịch* step, but section 3 holds the slot only after the deposit succeeds. Reword it.
- **Status names do not match.** Screen 2 uses *Đã xác nhận* for a conversation. Use these names on all three pages. Conversations: *Chưa trả lời, Đang tư vấn, Đã chốt lịch, Hoàn thành*. Bookings: *Chờ cọc 30%* (Screen 3 may show it as *Đã thống nhất lịch · Chờ cọc 30%*), *Đã đặt lịch, Hoàn thành*.
- **Things that lead nowhere.** *Booking, Lịch studio, Tài nguyên, Nhân sự*, *Xem đường đi*, *Ảnh đã chọn* and the footer links do not open anything. Remove them, or show them plainly as not available yet.
- **One story on all pages.** Names, times, package, prices and booking code follow the example in section 3.

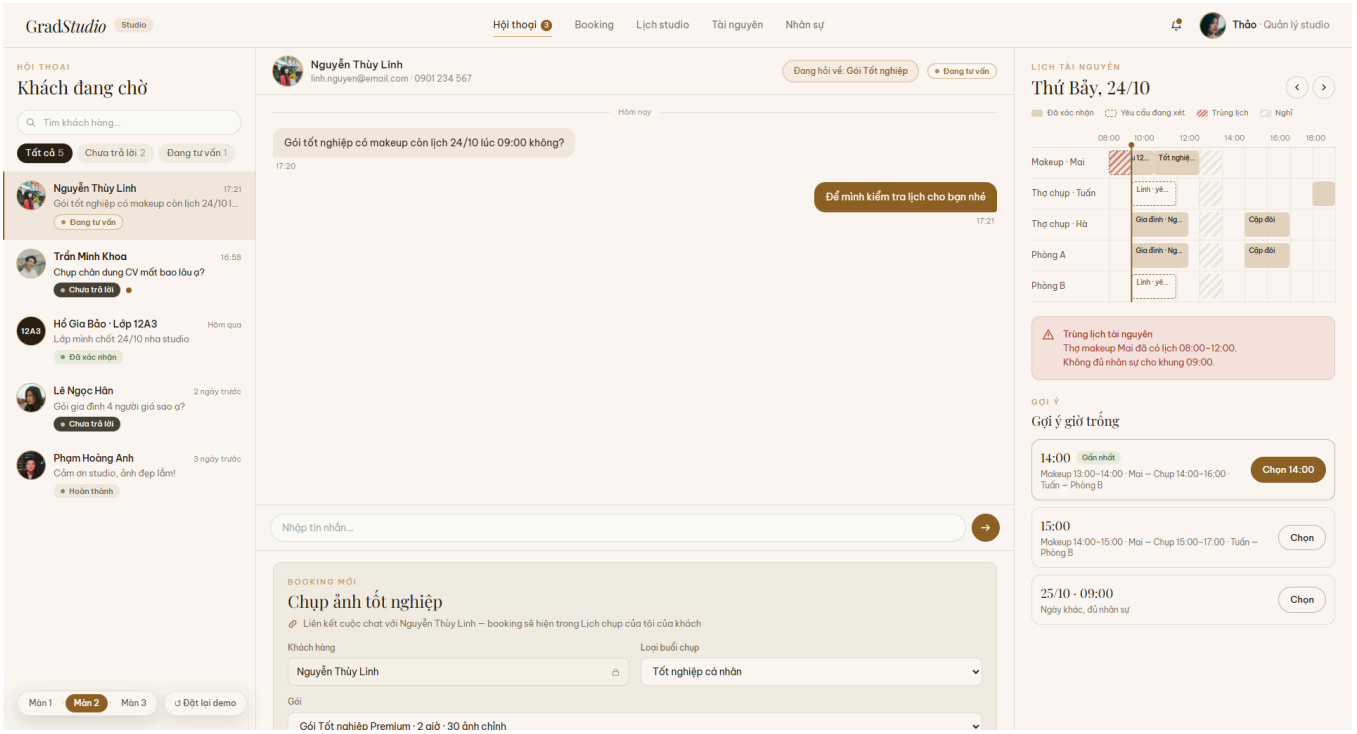

Screen 1 — Services and chat (customer)

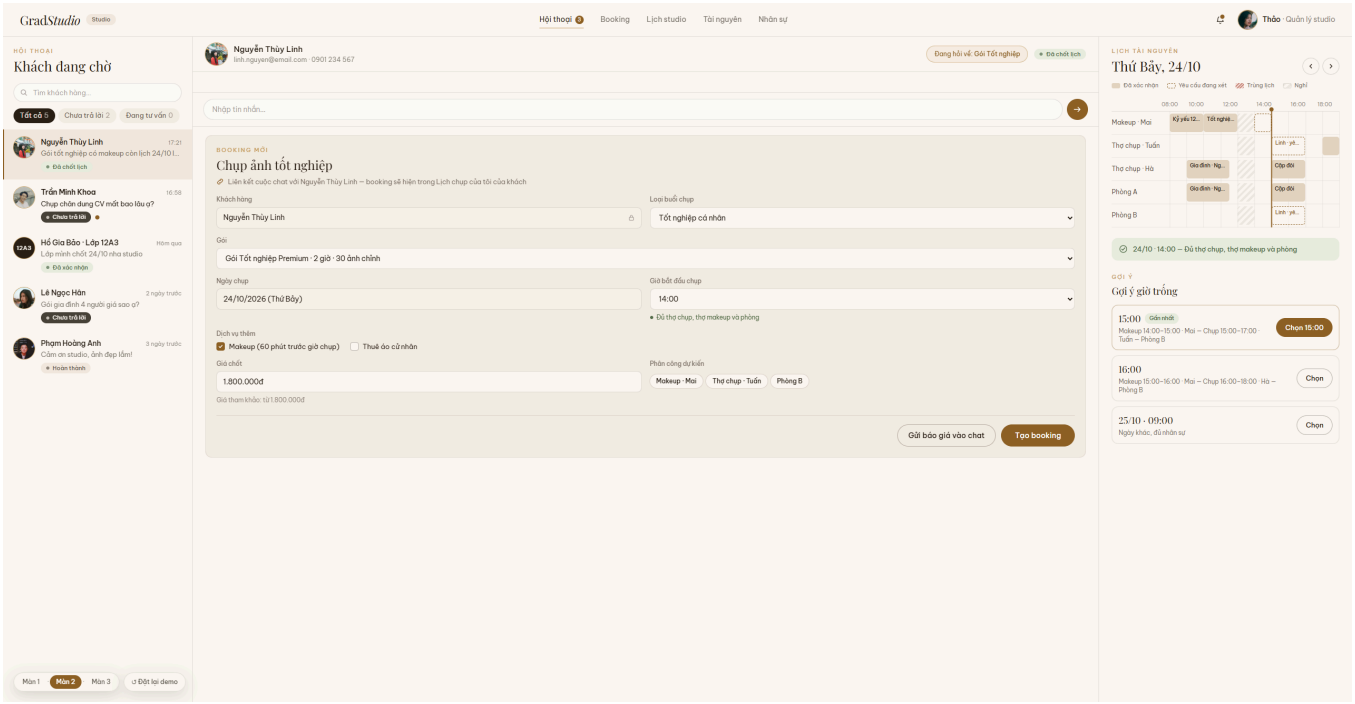

Linh looks for a suitable package and asks whether 09:00 is possible. The page introduces the studio and shows the three services: *Kỷ yếu lớp* (từ 350.000đ/người), *Tốt nghiệp* (từ 1.800.000đ), *Chân dung/CV* (từ 690.000đ). The chat shows "Gói tốt nghiệp có makeup còn lịch 24/10 lúc 09:00 không?" and the studio's reply that it will check. That message is what the Admin opens on Screen 2.

Screen 2 — Advice and clash handling (Admin)

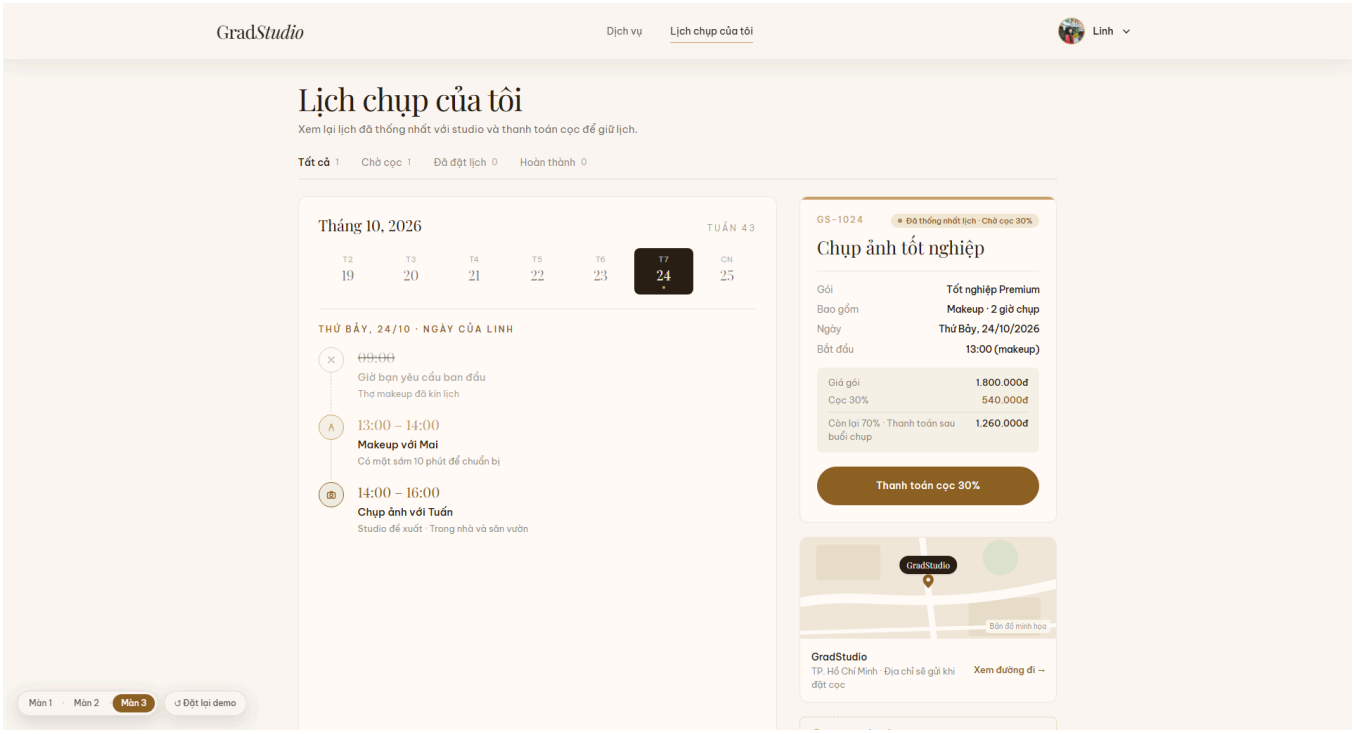

Admin Thảo finds a time with enough staff and rooms, and settles it with Linh in chat. Three areas: the conversation list, the chat with the *Booking mới* form below it, and the resource calendar with suggested times. In the authors' prototype, 09:00 reports a clash, because Mai is busy 08:00–12:00, and *Tạo booking* stays disabled until Linh agrees. Your page shows the state after she agrees (see *Fix these*).

Screen 3 — Review the appointment and pay the deposit (customer)

In *Lịch chụp của tôi*, Linh checks the agreed times and pays to hold the slot. The week view marks 24/10. The timeline strikes out 09:00 and shows make-up and the shoot. The booking card shows *Đã thống nhất lịch · Chờ cọc 30%*, the package, the price, the deposit and the remainder, with the button *Thanh toán cọc 30%*.

6. Product owners

The authoring team takes the lead on the product. They decide **how GradStudio behaves and what is in scope** wherever this brief is silent or leaves room, for example which parts of the scope can wait, or what a customer sees when a payment fails.

- **Ask** under the post *GradStudio — questions for the product owners*, which they open in the course Facebook group, starting with #WAD2431. Do not ask in private messages: one team's answer is everyone's answer.
- **Answers** come within two working days, under that post. A scope decision posted there applies to every team. Cite it in your repository when you rely on it.
- **What the product owners do not decide:** marks, deadlines, rubrics, and what PA#2 requires: the features of its three screens and the *Fix these* list. Those belong to the lecturer.
- The product owners build GradStudio like every other team and are marked the same way.
